

# **RV-500 Accessories**

## **Wind Protection Fan #1703**

The RV-500/501 can be affected by swirling or gusting winds. Gusting winds may affect the consistency of the water temperature. Slide-out compartments that are on the same side as the water heater will create turbulences. If you have a slide-out room on the same side as the water heater you need the Wind Protection Fan. In some circumstances, the internal wiring can become singed.

If you have a slide-out room or use your RV where wind gusts are common such as the desert or shore areas or use your RV at high altitudes, the Wind Protection Fan is strongly recommended. The Wind Protection Fan can be easily retrofitted.

---

## **Cold Weather Package #1966 (includes #1703 Wind Protection Fan)**

Instantaneous water heaters only come on when you turn on the hot water tap. Therefore, anytime the temperature drops to 32°F (0°C), they are susceptible to freeze damage. The RV-500/501, however, will turn itself on\* for short periods of time as the temperature approaches freezing. This will protect the unit down to temperatures of 20° F (-6°C). If it will be used in temperatures lower than this the Cold Weather Package is required.

The Cold Weather Package includes heating wire with a plug-in, insulation and the Wind Protection Fan. The Cold Weather Package will protect the RV-500/501 at temperatures as low as -20°F (-29°C).\*\*

**The Cold Weather Package is a factory installed option.**

**\*If power and gas are left on.**

**\*\* If plugged in and the power and gas are left on.**
